Letter of Recommendation: Adithi Jayaraman

To Whoever this may Concern,

I am happy to recommend Adithi for the research role in Robotics. As an undergraduate student studying a BSc in Robotics at Falmouth, she has proven to be a dedicated and effective learner. She has demonstrated strong programming skills in Python and C++, developing sophisticated architectures using OOP, SOLID principles, and design patterns to create control systems that incorporate machine vision, machine learning, and ODrive motor controllers. She has excellent capabilities in CAD and 3D printing, laser cutting, and general fabrication, alongside a solid understanding of control theory, artificial intelligence, motion planning, and kinematics.

Adithi has been a core planner and architect on two robotics team projects. In her second year, she was instrumental in developing an interactive robot artwork for the summer exhibition at the Falmouth Gallery. The controller allowed a camera to track a user's hand using OpenCV, then position a torch and control a rotating planetary gear assembly of prisms to reflect light across the gallery walls. In her third year, she is involved in a live research project with a Zoology PhD candidate to study the interaction between warthogs and mongooses. This involves developing a mimetic robot warthog in collaboration with the prosthetics department here at Falmouth. Adithi is driving the development of the robot locomotion system using ODrive bot wheels and remote control. She has also just completed a compelling Human-Robot Interaction project where users communicate their emotional state to a furry robot companion that responds in kind. Users can then respond by touching the robot, which uses a Hebbian Reinforcement Learning model to learn the desired response to the user's perceived emotion as interpreted from their voice.

Adithi has also demonstrated highly effective project management skills, deploying agile principles to team development and defining and delivering project sprints to ensure deliverables are on time and properly scoped and resourced.

She is conscientious, a good listener and communicator, able to question and intuit the requirements of a specific task or project with great effectiveness. She is also gregarious with her colleagues and clearly finds as much enjoyment in her work as she commits to its effectiveness.

Kind Regards

Matt Watkins
